1. Problem Statement

In a file management system, users are required to provide a valid file name when creating new files. The system enforces specific rules for file names to maintain consistency and avoid potential issues. Your task is to implement a Java program named FileNameValidator that takes user input for a file name and validates it according to the specified rules.

Rules for Valid File Name:

The file name must consist of alphanumeric characters (letters and digits) only.The file name must have a minimum length of 3 characters.

Implement a custom exception, FileNameValidator, to handle cases where the entered filename does not meet the specified criteria.

Input Format

The input consists of a string S, representing the desired filename.

Output Format

The output is displayed in the following format:

If the entered file name meets the specified criteria, the program outputs

"Valid file name"

If the entered file name does not meet the criteria and triggers the InvalidFileNameException, the program outputs

"Error: Invalid file name. It must be alphanumeric and have a minimum length of 3 characters."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: myfile123

Output: Valid file name

Answer

```
import java.util.*;

class InvalidFileNameException extends Exception {
    InvalidFileNameException(String message) {
        super(message);
    }
}

class FileNameValidator {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String fileName = sc.nextLine();

        try {
            validateFileName(fileName);
            System.out.println("Valid file name");
        } catch (InvalidFileNameException e) {
```

```
            System.out.println("Error: Invalid file name. It must be alphanumeric and
have a minimum length of 3 characters.");
        } finally {
            sc.close();
        }
    }

    static void validateFileName(String name) throws InvalidFileNameException {
        if (name.length() < 3 || !name.matches("[A-Za-z0-9]+")) {
            throw new InvalidFileNameException("Invalid");
        }
    }
}
```

Section 1 : Coding

1. Problem Statement

Bobby is tasked with processing a sequence of numbers from a monitoring system. He needs to extract a strictly increasing subsequence using an ArrayList. The program should dynamically add numbers to the ArrayList only if they are greater than the last number currently stored in the list. Bobby aims to efficiently utilize the dynamic resizing and indexing features of the ArrayList to solve this problem.

Help Bobby implement this solution.

Input Format

The first line of input consists of an integer N, representing the number of elements.

The second line consists of N space-separated integers, representing the elements.

Output Format

The output prints the list of integers in increasing sequence, ignoring out-of-order elements.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 7
3 5 9 1 11 7 13
Output: [3, 5, 9, 11, 13]

Answer

```
import java.util.*;

public class Main {
   public static void main(String[] args) {
      Scanner sc = new Scanner(System.in);
      int N = sc.nextInt();

      ArrayList<Integer> list = new ArrayList<>();
      int lastAdded = -1;
      boolean first = true;

      for (int i = 0; i < N; i++) {
         int num = sc.nextInt();

         if (first) {
            list.add(num);
            lastAdded = num;
            first = false;
         } else if (num > lastAdded) {
            list.add(num);
            lastAdded = num;
         }
      }
```

```
        System.out.println(list);
        sc.close();
    }
}
```

Section 1 : Coding

1. Problem Statement

Vikram loves listening to music and wants to create a simple playlist manager using Java Collections. The playlist supports the following operations:

"ADD <song>" Adds the song to the end of the playlist."REMOVE <song>" Removes the first occurrence of the song from the playlist. If the song is not found, do nothing."SHOW" Displays all songs in the playlist in order. If the playlist is empty, print "EMPTY"."NEXT" Moves to the next song in the playlist and prints its name. If the playlist is empty, print "EMPTY".

The playlist maintains a "current song" position that starts at the first song when it's added. The NEXT command moves to the next song and prints it, wrapping around to the first song after reaching the last song. When removing songs, the current position adjusts accordingly to maintain

proper navigation.

Help Vikram implement this playlist manager.

Input Format

The first line of the input consists of an integer n, the number of operations.

The next n lines, each containing a command:

- "ADD <song>"
- "REMOVE <song>"
- "SHOW"
- "NEXT"

Output Format

For each "SHOW" command, print the songs in order, separated by spaces.

For each "NEXT" command, print the next song in the playlist.

If no song exists, print "EMPTY".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 7
ADD song1
ADD song2
SHOW
NEXT
REMOVE song2
SHOW
NEXT

Output: song1 song2
song2
song1
song1

Answer

```
// You are using Java
import java.util.*;

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = sc.nextInt();
        sc.nextLine();

        LinkedList<String> playlist = new LinkedList<>();
        String current = null;

        for (int i = 0; i < n; i++) {
            String command = sc.nextLine();

            if (command.startsWith("ADD")) {
                String song = command.split(" ")[1];
                playlist.add(song);
                if (current == null) {
                    current = song;
                }
            }
            else if (command.startsWith("REMOVE")) {
                String song = command.split(" ")[1];
                boolean wasCurrent = song.equals(current);
                playlist.remove(song);
                if (playlist.isEmpty()) {
                    current = null;
                } else if (wasCurrent) {
                    // Move current to the next available song (wrap around)
                    current = playlist.peekFirst();
                }
            }
            else if (command.equals("SHOW")) {
                if (playlist.isEmpty()) {
                    System.out.println("EMPTY");
                } else {
                    for (String s : playlist) {
                        System.out.print(s + " ");
                    }
                    System.out.println();
                }
```

```
        }
        else if (command.equals("NEXT")) {
            if (playlist.isEmpty()) {
                System.out.println("EMPTY");
            } else {
                Iterator<String> it = playlist.iterator();
                boolean found = false;
                while (it.hasNext()) {
                    String song = it.next();
                    if (song.equals(current)) {
                        if (it.hasNext()) {
                            current = it.next();
                        } else {
                            current = playlist.peekFirst();
                        }
                        found = true;
                        break;
                    }
                }
                if (!found) {
                    current = playlist.peekFirst();
                }
                System.out.println(current);
            }
        }
    }
    sc.close();
}
}
```

Section 1 : Coding

1. Problem Statement

Assist Pranitha in developing a program that takes an integer N as input, representing the number of names to be read. Then read N names and store them in an ArrayList. Finally, input a search string and output the frequency of that string in the list of names.

Note: Some parts of the code are provided as snippets, and you need to complete the remaining sections by writing the necessary code.

Input Format

The first line of input consists of an integer N, representing the number of names to be read.

The following N lines consist of N names, as a string.

The last line consists of a string, representing the name to be searched.

Output Format

The output prints a single integer, representing the frequency of the specified name in the given list.

If the specified name is not found, print 0.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
Alice
Bob
Ankit
Alice
Pranitha
Alice

Output: 2

Answer

```
// You are using Java
import java.util.*;

public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int N = sc.nextInt();
        sc.nextLine();

        ArrayList<String> names = new ArrayList<>();
        for (int i = 0; i < N; i++) {
            String name = sc.nextLine();
            names.add(name);
        }

        String search = sc.nextLine();
        int count = 0;
```

```
        for (String n : names) {
            if (n.equals(search)) {
                count++;
            }
        }

        System.out.println(count);
        sc.close();
    }
}
```
